Burglar Alarm Systems

ID Card Design & Printing

Established: 2001

Form: Privately held corporation

Headquarters: Kaunas, Lithuania

Industry: Electronic Security and IT

Distribution network: Worldwide

Projects completed: 700+

Mission: Effective Integrated Solutions

Midpoint Systems provides software for integrated security projects. The core of the solution is electronic access control and it is supplemented by additional modules for logical access control (PC logon), time and attendance, IP video surveillance, burglar alarm, vehicle access control, biometrics, IDcard design and printing, billing for paid services, and data exchange with ERP systems.

CREDO Security Management Software. Powerfull and open.

The Midpoint flagship product called CREDO Enterprise is available in both Web interface and thick client options. The software runs on Microsoft platform and supports hardware of all major access control and biometrics hardware providers, including HID, Assa Abloy, Mercury Security and Suprema.

Years of expertise. Constantly innovating. Passionate about the product.

Our highly skilled team of international security experts and software engineers delivers better answers to the needs of installers and the ever-increasing requirements of end-clients. Midpoint is pioneering new fields and reshaping electronic security industry by leading the way to open standards, integration and improved user experience. Always in the lead, Midpoint was the first to offer a single solution for logical and physical access control, support for multiple hardware vendors in an open platform software, integrate IP-based burglar alarm system, mobile application that turns any Android device into access control and attendance terminal, and 100% IP-based security solution. The list continues and you can be sure Midpoint engineers are working on new and exciting developments as you are reading our company profile.

FOCUS ON VALUE

Rather than providing a narrowly specialized solution, Midpoint solution covers a wide range of business tasks that have synergy when combined: physical door access, security management, computer data security, employee time and attendance, billing for services and others. As the result, there is no double data entry and same data collection, network and identification devices serve multiple purposes. Combined with Midpoint Web Service API, data exchange with HR and Accounting systems becomes seamless and automatic, making client's business systems slimmer and more effective.

Synergy and integration

Traditionally enterprise-level security systems have been using closed architecture and proprietary protocols. Even world-class systems have been notoriously complex, inflexible and outdated. From user's perspective, they are often a burden and another negative line in the books. The fact that they are too expensive to be replaced is sometimes the only reason why end-users put up with such inferior solutions.

Midpoint is changing the rules of the game. There is no vendor lock in, users are free to choose components that best match their needs and combine equipment of different manufacturers. When time to upgrade comes, there is no need to replace an entire system, just selected parts. More-over IP-based systems, unlike their proprietary counterparts, are completely future-proof, making sure that customer's investment is safe for years to come.

Everything is possible!

Midpoint has always been regarded for flexibility and open-minded approach to projects. Each customer request is carefully evaluated and considered a positive contribution to product enhancement. When it comes to integration or custom development, there are no impossible tasks. CREDO Enterprise software is a live and constantly enhanced product that can be tailored to solve unique tasks. This makes Midpoint preferred choice in high-end security and integration projects.

Trusted by government agencies, banks, schools, factories and multinational corporations

No matter how powerful and advanced the system may be, it would be worthless without its users. Midpoint CREDO software has a proven track record in hundreds of projects across the globe and all types of industries: government, education, financial, energy, manufacturing. End user feedback is unanimous: “We love this software!”

The success of CREDO Enterprise software is largely attributed to usability features that make it exceptionally intuitive. Midpoint solution is having the same affect on security industry as Windows had on personal computer market years ago.

What makes Midpoint special?
Everyone loves our software!

“

“It works great, thanks”

“Software is very impressive”

“The new version works great and I love you GUI”
