Nearby Salzburg Airport, the McArthurGlen Designer Outlet Salzburg combines more than 200 fashion labels under one roof. EPS, the trusted system for affordable security will take care of the security side. The project was realized by the experienced EVVA partner PKS Sicherheitssysteme.

The shopping center with its high architectural appeal encompasses some 28,000 m² sales area covering two levels. Shops from various industry sectors and of various sizes have high demands in terms of a mechanical locking system. EPS (Extended Profile System), the trusted EVVA product with proven technology was able to meet these demands. Every shop has its own connecting passage and storage. One single key must be able to open and close both. EPS also secures lifts, doors in the underground car park as well as a fire brigade safe.

Versatile range of use, diverse requirements

The mechanical locking system must ensure security as well as flexible manageability. Plus, the system must be able to be expanded at any time. EPS is optimally suited for versatile use, is ideal for well-structured master key systems and clearly defined user groups.

Besides shop employees, security personnel, cleaning and maintenance staff as well as the management team of the outlet are among the user groups of the center. A total of more than 700 persons are administered.

EPS: patented technology & versatile use

The distinctive side coding and associated integrated manipulation control make the EPS key extremely secure. Thanks to the robust length profile and optimised lower key cuts, the EPS key is particularly easy to insert. The nickel-silver key is particularly wear-resistant and durable. Reliable technologies of the EPS cylinder, such as drilling, scanning, picking and optional plug pulling protection safeguard against illegal opening techniques.

Walter Hauser, Designer Outlet Facility Manager, is fully satisfied with the mechanical locking system. "The security and administration of the system work perfectly", says Hauser.
